(54) Title: A METHOD AND AN ARRANGEMENT RELATING TO GROUPS OF COMMUNICATING USERS

(57) Abstract: Services obtained include group voice messaging and group talk. Private voice mailboxes can be accessed and used by groups of people. When a new message is added or a user wants to initiate a group talk session, an SMS is sent to group members to inform them that they should check the group voice mailbox or inform them that they should call in to join the group talk.

A METHOD AND AN ARRANGEMENT RELATING TO GROUPS OF
COMMUNICATING USERS

TECHNICAL FIELD

The present invention relates to a method and a digital telecommunication system where groups of users of communication devices exchange information between each other.

BACKGROUND OF THE INVENTION

Present day telephone systems for conveying messages to groups of people and systems for performing simultaneous conversations with several people have many disadvantages.

In order to get in touch with, and convey a message to a group of people, it is necessary to get in touch by making several telephone calls, one to each designated person. This is, needless to say, both time-consuming and expensive.

Setting up of so-called conference calls is, in addition to being time consuming and costly, also very complex and usually calls for a large measure of planning ahead for the participants.

SUMMARY OF THE INVENTION

It is an object of the present invention to overcome the problems as discussed above. This object is achieved by inventive systems, methods and computer software according to the appended claims.

The system, which in the following will be denoted as the mobile community, offers mobile group communication services, enabling groups of people to stay in touch, coordinate events and share information anywhere and anytime via mobile devices such as mobile phones and mobile internet devices.

anytime via mobile devices such as mobile phones and mobile internet devices.

The services offered include group voice messaging which offers private voice mailboxes that can be accessed and used by groups of people. When a new message is added, an SMS is sent to group members to inform them that they should check the group voice mailbox. An e-mail is sent to users who do not have a mobile phone.

Another service offered is group talk which allows users to talk to each other simultaneously on mobile phones and fixed-line phones. When a user wants to initiate a group talk session, an SMS is sent to group members to inform them that they should call in to join the group talk.

Another service offered is group text messaging which allows group messaging via SMS. The sender only needs to send a single SMS which is sent to the group members.

Also a group web service is provided, which includes text chat, group contact lists, calendar and information lists, such as e.g. recommendations regarding restaurants, cinemas etc. The group web services are accessible via mobile and stationary internet devices such as WAP-phones and desktop PC's.

Groups are created and managed via a web site, and users may create and participate in any number of groups with friends, business colleagues, project team members, family members, sports club members etc.

Privacy is obtained through authorization, where each member is identified through a user ID and an access code. Typically, for mobile phone users, their mobile phone number acts as user ID.

Groups of users may be either static or dynamic. Static groups are preferably used when a user wants to leave messages to, or communicate with, the same people regularly. Dynamic groups are used when recipients are unique for each message or call. Dynamic groups exist for

one message or call, and are created by selecting recipients via the WWW or via telephone.

Broadcast groups are used for one-to-many communication, where one single member, the messenger, is allowed to
5 leave messages in the group mailbox. Other members can read messages and leave responses to the messenger only.

Advantages obtained with the present invention, Mobile Community, include access at any time and anywhere, convenience in that a user may communicate with several
10 people simultaneously via a single phone call. Furthermore, cost is reduced, as compared with previously known systems, in that the caller only need to pay for a single call since recipients call in to the system and pay for their calls themselves. The ease of use is also
15 an advantage, since administration of groups is handled via World Wide Web (WWW) pages on a server accessible from anywhere via the internet.

BRIEF DESCRIPTION OF THE FIGURES

Figure 1a shows a schematic view of a system according to
20 the invention.

Figure 1b shows a schematic end-user view of a system according to the invention.

Figure 1c shows a schematic administrator view of a system according to the invention.

25 Figure 1d shows a schematic view of an application server included in a system according to the invention.

Figure 1e shows a schematic view of a SM server included in a system according to the invention.

Figure 1f shows a schematic view of a group talk service
30 included in a system according to the invention.

PREFERRED EMBODIMENTS

- For illustrative purposes, the detailed description of the present invention is separated into a number of different parts. To begin with, the system architecture
20 of the Mobile Community system will be described.

Following that, a description of the system interfaces with telecommunication networks and service providers. Then follows a detailed description of the functions performed by the system in use.

- 25 The embodiment of the invention will be exemplified in connection with cellular telecommunication systems adhering to the GSM standard, and hence a number of abbreviations will be used that are known to the skilled person, and will not be explained in detail.
- 30 Nevertheless, some vocabulary, terms, definitions, and abbreviations used in this description are as follows:

Abbreviation	Description
CORBA	Common object request broker architecture
EJB	Enterprise Java beans
35 HTML	Hypertext mark-up language
HTTP	Hypertext transport protocol

	HTTPS	Secure hypertext transport protocol
	JDBC	Java database connectivity
	JSP	JavaScript pages
	MS	Mobile station, i.e. a cellular phone.
5	MSC	Mobile switching center.
	ORB	Object request broker.
	RDBMS	Relational database management system.
	RUP	Rational unified process.
	SM	Short messages.
10	SMS	Short message services.
	SQL	Standard query language.
	SSL	Secure sockets layer.
	WRB	Web request broker.
	WWW	World-wide web, the Internet.
15	XML	Extended mark-up language.

The architecture is most easily described using five views, which represent different ways of observing the system: a logical view, a process view, a deployment view, an implementation view and a use-case view.

- 20 The logical view describes the architecturally significant parts of the design model, such as its decomposition into subsystems, service packages, and classes. The process view describes the system's decomposition into lightweight processes (single threads
- 25 of control) and heavyweight processes (groupings of lightweight processes). The deployment view illustrates the configuration and a mapping of processes to each processor. The implementation view describes the decomposition of the software into layers and subsystems
- 30 in the implementation model. Sometimes referred to as component view. The use-case view illustrates how the software actually works by giving a few selected use cases or scenarios. The view also explains how the various model elements contribute to the functionality.
- 35 The use cases or scenarios given here are chosen because they represent some significant, central functionality of

the final system, or for their architectural coverage (they exercise many architectural elements) or to stress or illustrate a specific, delicate point of the architecture.

5 The logical view

Figure 1a illustrates the architecturally significant parts of the design model, such as its decomposition into subsystems and service packages. For each significant package, its decomposition into classes and class
10 utilities is described.

Architecturally significant classes are introduced and their responsibilities described, as well as a few very important relationships, operations, and attributes.

Figure 1 shows the major components of the system: End
15 User interface components, Administrator interface components, Mobile Community services (with web services for end users and administrators and community services like group talk and group messages), Network provider for SMS services, and SMPT provider, for sending e-mail.

20 End user

As figure 1b illustrates, there are four different methods of end user - system interaction: WWW browser, Mail client, Phone, and Mobile phone. The user uses the WWW browser to connect to the system to set up and manage
25 his/her profile and communities and the mail client is used for different notifications sent from the system.

A mobile station may receive notification messages (SM) from the system via the network providers switching center. A mobile phone is used to manage the community
30 services like group talks and group messages. A normal phone can also be used, like the mobile station, to manage the community services.

Administrator

As figure 1c illustrates, there are three different methods of administrator - system interaction: WWW browser, Mail client, and Mobile phone. The administrator uses the WWW browser to connect to the system to perform system administrative tasks. The mail client and the mobile phone are used for different notifications sent from the system.

It shall be noted that the Mobile Community Services system will interact with the network provider and the SMSC using a secure protocol.

SMTP provider

The SMTP provider is a mail server that route mail sent from the mail services to users mailboxes on the Internet.

Mobile Community Services (MC services):

Web server/Java Server Pages

The web server handles incoming HTTP requests; retrieves information, and sends it back to the client. If the HTTP-request is targeted at a JSP (Java Server Page), the request is handed over to the JSP-engine.

Application server

As figure 1d illustrates, the system runs in an application server but no business or data logic is implemented as Enterprise Java Beans. The application server is used as execution environment for Java Server Pages and for the Connection Pool only.

The application server comprises of the following three major components (access layers): JSP engine (compiler/-executioner), Business services, Data services, and Connection Pool.

JSP engine

The JSP engine is a java class that creates a java servlet code out of the jsp-code and then compiles it

into a java servlet class. The class code is cached for performance.

The Business services

Design packets in the business services layer contain
5 most of the service logic of the system. All access of
data services from the user services layer is handled
through the business services layer.

The following design packets are developed within the
Mobile Community Services system: crypto, sms, mail,
10 administrator, alarm, broadcast, community, event,
grouptalk, invitation, message, news, statistics,
trafficdata, user, and util.

Data services

The data services design packets consists mainly of
15 components and classes to access entity objects from the
database. This includes creating new, modifying, and
removing existing entities as well as searching and
listing functionality. The packets are not listed here.
For a complete list of available packets, consult the
20 database design. Examples are: User, Event and
Invitation.

Mail services

The mail services include services for sending email
(SMTP). The mail is sent through the SMTP provider.

25 SM services

As figure 1e illustrates, the SM server provides
functionality to send SM to mobile phones from a client
application in a LAN. The system consists of an SMS
server that acts as an interface to the network
30 operator's SMS gateway and a number of SMS clients that
serve applications with the possibility to send SM
requests to the SMS server.

Group talk system

As figure 1f illustrates, the Group Talk System provides a service for community groups to join specific group calls. The service is available from a mobile phone or a normal fixed phone.

- 5 The group talk services does not use any of the application server functions. The business and data logic is called directly from the CT run-time environment through a DLL.

The following functionality is provided within the Group
10 Talk services: Group call capabilities, Recording voice messages, Pre-recorded audio messages for information from the system to the user, Touch-tone input for login to system, setting up and joining a group call, and Dial out enabling the system to make calls to users and play
15 pre-recorded messages.

Group message system

As figure 1g illustrates, the Group Message System provides a service for community groups to record and listen to voice messages located in a message store. The
20 service is available from a mobile phone or a normal fixed phone.

The group message services does not use any of the application server functions. The business and data logic is called directly from the CT run-time environment
25 through a DLL.

All voice messages is stored as flat binary files in the file system of the OS of choice. META-information about recorded messages is stored in the RDBMS. The realisation and implementation of this message is store is TBD.

30 The following functionality will be provided within the Group Message services: Recording voice messages, Listening to voice messages, Pre-recorded audio messages for information from the system to the user, Touch-tone input for login to system, recording messages and
35 navigation through system functions, and Dial out

10

enabling the system to make calls to users and play pre-recorded messages

RDBMS

5 All system information, except the recorded voice messages for the Group Message Services, is stored in a relational database (IBM DB2). Any META information about recorded voice messages is also stored in the RDBMS.

Message store

10 All voice messages for the Group Message Services are stored as flat binary files in the file system of the OS of choice. META-information about recorded messages is stored in the RDBMS.

Process view

15 This section describes the systems decomposition into lightweight processes (single threads of control) and heavyweight processes (groupings of lightweight processes). Figure 2a shows the major processes and groupings thereof in the system.

Processes

20 This section describes of the heavyweight processes in the system, shown in figure 2a.

Web server and application server

The web server and application server is described elsewhere.

25 SM Server

As figure 2b illustrates, the SM server application consists of one permanent lightweight process running the administration interface. From the GUI thread a server thread is started and stopped. The server thread handles
30 new client connections and administrates the requests. The GUI and server threads exchange data mainly by using a common instance of a class containing the server characteristics.

Beside these single threads, there are an arbitrary number (upper limit controlled by the server administrator) of session threads that are started and stopped as clients connect and disconnect. The server
5 thread creates the session threads, one for each client connection. The session threads take over the client connections and execute the requests. As response is received from the SMS Gateway and forwarded to the client, the session thread stops.

10 RDBMS

All system information, except the recorded voice messages for the Group Message Services, is stored in a relational database (probably Oracle).

Any META information about recorded voice messages is
15 also stored in the RDBMS.

CT Services

These are the group message and group talk systems.

The server (or rather, service) is build on the run-time engine of the selected CT-platform and uses the same
20 business and data logic as the web application.

Deployment view

Figure 3a shows the system's physical network (hardware) configuration on which the software is deployed and run. The configurations indicate the physical nodes
25 (computers, CPUs) that execute the software, and their interconnections (bus, LAN, point-to-point, and so on.) Included is also a mapping of processes from the process view onto physical nodes.

In detail, the system is described with different
30 configurations, called minimum configuration and multiple node configuration.

Figure 3b illustrates a "minimum" configuration, which is in reality not a single node due to the two parallel systems and the Data server and SMS server.

All telephony related services execute in one node and the web services, the application server and the SMS server execute in the other. Depending on the type of toolkit/api used in the phone-related applications, the phone services may be able to use the application server for distributed business objects and access to the RDBMS.

Phone services server

The telephony server is equipped with several PRI-cards and DCB-cards (for conferencing). These cards are connected through a SC-bus for internal communication between CT-resources.

Web services server

All presentation logic is implemented as Java Server Pages (JSP), handled by the JSP engine installed in the web server.

All business and data logic for the web-services is implemented as normal Java classes, not EJB.

In a single node configuration, this node is configured with a web server and the application server of choice.

The SMS service may also execute in this server, but there is a choice to install and execute this application on a separate server.

Data server

In the Data server executes the RDBMS. This is also the server where all messages are stored.

Multiple-node configuration

Figure 3c shows a "multiple-node" configuration, where the amount of concurrent and registered users demands multiple web servers and phone servers.

The servers in the multiple node configuration is explained below.

Phone services server

Adding another server scales the Phone Services. The problem with adding another external node is to expand the SC-bus, which connects the PRI and DCB resources. Connecting the different computer nodes with an external
5 ATM-bus solves this.

Two computers can be connected directly via ATM, but if three or more computers are to be connected, this is best done through an ATM-switch.

Application server

- 10 All business and data logic for the web-services is implemented as normal Java classes, not EJB.

In a multiple node configuration, separate servers are used for the application servers. Adding another physical server with yet another application server running on it
15 scales the business and data logic. The application servers handle the scaling and load balancing through AS to AS communication.

Web server

- All presentation logic is implemented as Java Server
20 Pages (JSP), handled by the JSP engine installed in the web server.

Adding yet another physical web server scales the web servers. The incoming requests for web resources are distributed between the web servers through round-robin
25 configuration of the DNS , or by doing a sequentially redirecting of the requests through a front-door web application.

All web servers have the same host name, but different IP-addresses. The DNS-server that resolves a host name to
30 an IP-address does this in "round-robin" order so that the requests are distributed to all available web servers.

Database server

In the Mobile Community system, adding another server does not scale the database. The database should run on such hardware that it could be upgraded with more CPU, disks and memory when needed, preferably from the beginning to avoid minimum downtime because of hardware upgrades.

Message store server

To scale the message store (where all voice messages are stored as files), more disk space is achieved by adding yet another physical computer with RAID-disks.

The MC-system must be aware that more disks have been added for the voice files. Changing the system parameters (configuration) for the MC-system does this.

SMS server

This is the node where the SMS server executes. This server is able to handle thousands of SMS-requests and does not need to be scaled into multiple nodes for the MC-system. The SMS server may very well execute in one of the application server computers, because of the low impact on the system resources.

Implementation view

Figure 4 shows the decomposition of the software into layers and subsystems in the implementation model.

A number of different layers exist within this project.

All layers will be described below. The picture below shows how the different applications are built on top of different layers.

Layer descriptions

Description of the application layers in the system.

30 Phone users IVR

The mobile and fixed phone users use an IVR (Interactive Voice Response) system to navigate through the different

applications and functions available through the phone interface.

CT applications

The CT applications are running on top of the selected CT
5 runtime engine.

HTML GUI

The GUI (Graphical User Interface) for web browsers is built with HTML (Hypertext Mark-up Language) and served through a web server.

10 JSP

The JSP (Java Server Pages) handles the presentation logic (serving/building HTML) and is responsible for instantiating and executing the business logic objects.

Business and data logic

15 The business and data logic is implemented as normal Java classes and not as EJB, because of performance and because the CT application has problems accessing EJB from their run-time environment.

Size and performance

20 Below is a summary of target performance such as throughput and response times.

Scalability

The Application server should be scalable by hardware. For detailed description of scaling, see "Deployment
25 view" above.

Load balancing

Load balancing can be configured for three services in the system: Web servers, Phone servers, and Application servers.

30 Load balancing of web servers

As illustrated in figures 5a and 5b, the incoming requests for web resources are distributed between the

web servers through round-robin configuration of the DNS, or by doing a sequentially redirecting of the requests through a front-door web application.

5 All web servers have the same host name but different IP-addresses. The DNS-server that resolves a host name to an IP-address does this in "round-robin" order so that the requests are distributed to all available web servers.

10 All first web requests from a web user goes to one web server and is handled by a "front door" application. The "front door" redirects the user sequentially to the next available web server in the system. All following web requests from the user is handled by that server. The web servers in this solution must be configured with different host names as well as different IP-addresses.

15 Load balancing of phone services

The incoming phone lines are configured according to the standard "Line hunting" procedure that distributes the incoming calls sequentially to the available PRIs.

20 A conference resource handler in the CT-application will allocate the conference resources. The conference handler will store status information about all conference resources in RDBMS. Analysing which device that for the moment has most idle conference resources makes the selection of conference device.

25 Load balancing of application server

Load balancing is built into the application server software. If another application server is installed, this is initially configured to be aware of the other existing application servers. The load balancing is then
30 handled by the software through AS to AS communication.

Fault Management

Software and hardware will be monitored by an SNMP fault management system. SNMP-agents will be installed for each server and hardware device. The agents will monitor the

devices for errors and report to an SNMP management application if errors occur. Overload and congestion is also to be considered as an error.

The following hardware devices and software can be monitored over SNMP. Monitored Hardware includes: PRI-boards, Audio Conference boards, Network controller boards, CPU-boards and ATM-switch. Monitored Software includes: CT-application, Webserver, Application server, SM server, RDBMS, and Windows NT.

10 Failure recovery

The system is not configured with any fail-over functionality. For maximum safety and minimum down-time: install multiple network adapters, use double power supply units in the servers, all disks should be RAID-configured for safety (1, 5 or combination), and CT-servers shall continue to execute Group Talk and Group Message calls even though another CT-server is out of service.

System interfaces

20 Figure 6 illustrates how the system according to the present invention interfaces other network elements such as an MSC, a local exchange, an SMS-C and the Internet.

The system connects with the MSC(s) of one GSM operator through a number of EURO-ISDN devices (30B+D.)

25 Telephony interfaces

The Mobile Community service is accessed via one GSM number. This number is routed to a number of ISDN PRA interfaces (2 Mb, 30 B+D) residing in one or several MSCs. The MSC(s) must support line hunting over the full set of PRA lines. The normal initial configuration is with 6 PRA.

Preferably, both incoming calls (to access the Mobile Community service) and outgoing calls (to make dial-up notifications for Group Talk from the Mobile Community

system) are used. If outgoing calls are not possible via this PRA interface, an alternative is to use ISDN PRA lines to the fixed network.

For outgoing calls, a feature called "time distribution of dial-out notifications" is available with the Mobile Community system. This feature distributes dial-out notification calls within a certain group. The time difference between calls within a group is 0.5 seconds. This is done in order to avoid congestion on the GSM paging channel within one cell.

The specification of the interface includes: Euro-ISDN, CRC4 activation and no ecco cancellation equipment between the MSC and the Mobile Community system.

This interface is carried between the operators MSC switch site(s) and the Mobile Community operation center via G.703 lines.

SMS interface

The Mobile Community system interfaces a Short Message service provider via the interface "UCP over TCP/IP". This interface has SSL encryption. The Short Message service provider could be the GSM partner, but it is also possible to use other service providers in case cross-network SMS are not available within the country where the system is set up.

The SMS originates from a specific server located inside the Mobile Community system firewall. A port must be opened in the firewall for this communication. The port number is configurable.

The Internet or any leased TCP/IP connection can be used for the communication between Mobile Community system and the SMS-C. "SMS queuing" is used to handle SMS load peaks.

Internet interface

Internet (WWW) can be used by the Mobile Community system users to configure their groups, invite more members, create new groups etc.

Hypertext Transfer Protocol (HTTP) as defined in RFC 2616
5 and RFC 2068 is used.

System functions

Following is a description of preferred functions of the Mobile Community system. The description will use the so-called Rational Unified Process (RUP). RUP is a project
10 work model by Rational Corporation. Quality and a secured delivery plan are major concerns of the work model. Two basic elements of this use case driven work model are the actor and the use case.

Definition of Actor

15 An actor instance is someone or something outside the system that interacts with the system. An actor type defines a set of actor instances, in which each actor instance plays the same role in relation to the system.

Definition of Use case

20 A use-case instance is a sequence of transactions a system performs that yields an observable result of value to a particular actor. A use-case class defines a set of use-case instances.

The following actors have been identified: Administrator,
25 Guest, User, and Instant user.

Administrator

An administrator is a registered and authenticated person that has the privilege to administrate the Mobile Community system, or specific parts of the system. Use
30 cases involving administrators almost always require strong authentication. The preferred method of administrator - system interaction IS via a WWW browser.

Guest

A guest is a person who accidentally or determined surfs' the Mobile Community web site or calls the system for registration. Being a guest seldom requires authentication. As a guest registers for member services
5 he is upgraded to user actor. There are three different preferred methods of guest - system interaction: WWW browser, and Mobile or stationary phone User.

A user is a registered and authenticated person who actively uses the member services provided by the Mobile
10 Community system. Use cases involving users most often requires authentication. There are three different preferred methods of user - system interaction: WWW browser, and Mobile or stationary phone User.

Instant user

15 An Instant user is a person that is invited to a group talk but that is not registered with the system. Typically, an instant user is a person that is temporarily invited by a user to participate in a group talk. Instant users can never initiate their own group
20 talks. There is one preferred method of instant user - system interaction, that is via a Mobile or stationary phone.

USE CASES

In this section the required system is identified and
25 described. Defining the actors and use cases in the system does this.

Web use cases

These web use cases are use cases related to functions and operations performed at the Internet web site.

30 Web Demo

Actors: Guest.

Purpose: Demonstrate the member services.

Web Company Information

Actors: Guest.

Purpose: View company information.

Web Help

Actors: Guest, User.

- 5 Purpose: Get helpful information and tips.

Description: It shall be possible to obtain help text on most web pages. However, advanced help texts are not required.

Web Register

- 10 Actors: Guest.

Purpose: Register for member services.

Description: By registering a new user account is created within the system. The guest has the possibilities to register the following data:

- 15 • Name/alias (mandatory)
• Phone number (not mandatory)
• Email address (not mandatory)
• Anonymity (mandatory. The guest has to specify whether he shall be "visible" or "invisible" in the public
20 functions of the system. Default value is visible.)
• User description (not mandatory, the user may add a short description of himself that is shown in other users contact lists if the user has chosen to be visible as described above).

- 25 The guest is not allowed to register an email address or a phone number that already is used in the system by another user.

- If he registers a mobile phone number, the system will verify, using a random generated access code sent to that
30 specific phone as SMS, that he at least actually has access to the mobile phone he registers.

If an email address is registered a notification will also be sent to that address i.e. this is the only

possibility for a user with a non-SMS capable phone to get a notification.

The new user is given a unique member number, which in normal cases is the phone number registered. If he elects
5 not to register phone number, a unique member number is to be generated by the system. This is also the case if the new user registers a non-SMS capable phone. A personal user profile is created describing the provided information, privileges, etc of the new user. If he have
10 received invitations for any communities, he is immediately prompted to join them.

Web Welcome

Actors: Guest, User.

Purpose: To gain access to the member services.

15 Description: This is the web site entry point. Here the user may choose to access either register, login, or view any of the public information web pages like service introduction, demo, or company information.

For example; <http://www.incirco.se>

20 If the user have received invitations for a community by email and accessed the web site via an invitation URL, the web page is to show a welcome greeting for the invitation.

Web Login

25 Actors: User.

Purpose: User authentication.

Description: Used to authenticate that only registered users gain access to the web site member services. User states unique member number and access code. The user
30 will only be permitted to make a limited number of login trials, then the account will be temporarily blocked. The user is upon success transferred to his start page.

If the user was registered from the TUI he is forced to enter missing data (see section 5.1.8) before he is transferred to his start page.

- 5 If the user has created any new communities from the TUI he is forced to enter a community name (see below) before he is transferred to his start page. This is also the case if the user has changed name from the TUI since last web login.

My Communities

- 10 Actors: User.

Purpose: A users personal start page.

Description:

- Gives the user an overview of the communities in which he is a member.
- 15 • Informs of new invitations: A list of the user's pending invitations will be shown. Next to each community there will be a link to click to see more details about the invitation, see section 5.1.19.
- Gives a summation of all community news.
- 20 For each community the user is member of the degree of anonymity is shown (i.e. if details of the personal profile are hidden for other members or not). The anonymity degree can be changed using the radio button that is assigned to each community.
- 25 The "My communities" page contains a string that informs the user when he used the system last time. In this information it is included whether he used the TUI or web interface.

The user's name is displayed on the web interface.

- 30 Web Complete User profile

Actors: User.

Purpose: To enter missing data if user was registered from TUI.

24

Description: If the user was registered from a phone (fixed or mobile) and it is the first web login after registration, a new web page is opened where he is asked to give additional missing user data. At a minimum he
5 should enter his name or alias. The user is not transferred to his start page until at least his name or alias is given.

Web Enter Community Name

Actors: User.

10 Purpose: To enter the name of a community created via TUI.

Description: If the user has created one or more communities since last web login (i.e. community creation from the TUI) a new web page is opened where he is asked
15 to type the names for those communities. This is done at first login after the creation and is mandatory. The user is not transferred to his start page until a name is given. The system does not perform any checks whether the community name, entered at web interface, matches the
20 spoken community name.

Community Administration

Actors: User.

Purpose: Enable community administration.

Description: A web page containing information and access
25 to community administration functions and operations as invitations, community owner, remove the community, leave the community, modify description of the community, change category of the community and to change name of the community. If the community owner chooses to change
30 the name of a community all members of the community is notified. The notification is performed in the same way as the invitation to the group (but telling the members that the current community name is changed).

All the above mentioned functions and operations are available only to the community owner but to leave the community, which is open to all members.

Note. Preferably, a user can only see the interface for the functions and operations that the user is allowed to perform. I.e. the functions and operations that are assigned to the community owner can only be seen by the community owner.

My Settings

10 Actors: User.

Purpose: View ones own personal profile.

Description: All user data are shown.

From this use case it is possible to

- change anonymity (start of use case Change anonymity)
- 15 • change access code (start of use case Web change PIN code)
- update personal data (start of use case Personal data)
- quit membership (start of use case Quit membership).

Change Anonymity

20 Actors: User.

Purpose: To change the user's anonymity setting.

Description: The user gives the possibility to change the anonymity setting, i.e. whether he shall be visible or invisible to other users when these are using the public functions of the system.

News

Actors: User.

Purpose: Gives the user a summary of community news and updates.

30 Description: For each community the user can view new messages, new members or members who left the community, new community owner, if any members have updated their

contact info, etc. Each new Group Message or Group Talk recording notification is attached with a time stamp.

Web Create Community

Actors: User, Guest.

- 5 Purpose: Create a new community.

Description: The user creates a new community by naming the community. The person may also choose to assign a category to the community and a description of the community. The user may invite members by selecting
10 people from his existing contact list (not possible for a guest) or by entering them manually. The invitation shall contain the names/alias of other invited persons (users or guests). This is applicable both to the e-mail invitation sent out and on the "New invitation" page on
15 the WEB.

Another way of inviting members is to send them an invitation URL.

If an invited person (user or guest) hasn't replied to the invitation within a predefined number of days (a
20 system parameter configurable by the system administrator) an alert might be sent to the community owner. An alert might also be sent to the invited person. It is possible to configure these alerts independent of each other, e.g. in one implementation of the system both
25 kinds of alerts might be used, but in another implementation, only the alert directed to the community owner might be used.

If the user invites a person with a forbidden number (i.e. the user states a number stored in the "Dialing
30 Rules File") the user shall be notified and that invitation is cancelled.

The creating user becomes the "community owner".

Note. If a guest sets up a group, no invitations will be performed until the guest has registered. If the guest

leaves the system without having registered the group will be removed.

Invite Members

Actors: User.

- 5 Purpose: Invite others as members of a community.

Description: The community owner may invite additional members to his community by selecting people from his contact list or by entering them manually. The invitation shall contain the names (or alias) of other invited
10 persons (users or guests) and the users that already are members of the group (these are listed as "member" in the invitation). This is applicable both to the e-mail invitation sent out and on the "New invitation" page on the WEB.

- 15 Another way of inviting members is to send them an invitation URL.

If an invited person (user or guest) hasn't replied to the invitation within a predefined number of days (a system parameter configurable by the system
20 administrator) an alert might be sent to the community owner. An alert might also be sent to the invited person. It is possible to configure these alerts independent of each other, e.g. in one implementation of the system both kinds of alerts might be used, but in another
25 implementation, only the alert directed to the community owner might be used.

If the user invites a person with a forbidden number (i.e. the user states a number stored in the "Dialing Rules File") the user shall be notified and that
30 invitation is cancelled.

Mass Invitation

Actor: User

Purpose: Allow the user to invite many members to a group in an efficient way

Description: The use case starts when the user select to invoke the user interface for "Mass invitation"

The user selects which persons to invite to the group by specifying their e-mail addresses separated by comma or
5 semicolon (to allow "copy and paste" from e-mail clients) in the in built mail function of the system.

The user can write a message to the recipients of the invitation that will be displayed first in the invitation e-mail (followed by a standard description of the
10 service).

The user submits the invitation to the system and all recipients will receive the e-mail invitation.

Web Instant Group

Actors: User.

15 Purpose: Allow a user to quickly set up group

Description: From the web, the user can select from his contact list or enter new persons, i.e. instant users, to invite them to the group talk. If the user invites a person with a forbidden number (i.e. the user states a
20 number stored in the "Dialing Rules File") the user shall be notified and that invitation is cancelled.

The instant group that is created shall be saved in the system and the user can initiate a group talk and group messages with the participants in the instant group
25 without having to enter their numbers again. The instant group is replaced the next time the user creates a new instant group. A user can only have one instant group.

Web Join Community

Actors: User

30 Purpose: Allows a user to join a community.

Description: The system prompts the user with new invitations. The user can then choose to

- Join (accept).

- Join (accept) but hide details in the personal profile to other users in the group (only the first name/alias is shown).
- Not join (reject).

5 The default value is Join.

For each invitation there is a link to further invitation details, see below regarding invitation details.

Web Invitation Details

Actors: User

10 Purpose: Allows a user to view details of an invitation to which he is invited.

Description: For each invitation the names (or alias) of other invited users and guests that also is invited to that particular community are displayed. If the user is
15 invited to an existing community, the users that already are members are listed as "member". It is also displayed which of the invited persons that has joined the community and which that haven't.

Web Contact List

20 Actors: User.

Purpose: Allows the user to create and maintain a list of other users.

Description: A user is given the possibility to store contacts in a contact list. The contact list contains
25 other users in the system that manually are added by the user according to the Add contact use case, see below.

For each contact, the contact list consists of the following fields:

- Short Code [digits 1-99]
- 30 • Note [text field of 160 characters that are defined by the user to describe the contact]
Description (the contacts own description of himself)

30

- First Name/alias (used to sort the list alphabetically)
- Last Name
- MSISDN/Member no (Member no if no MSISDN is present)
- 5 • email address

Only the "Short Code" and the "Note" fields are editable by the user.

Note. Whether the data in the fields of a contact are visible or not is dependent of what the contact has
10 specified when registered (or when modified the personal profile).

What actually are shown is specified in the UCR of the use case.

The system is able to maintain a list of up to 999
15 contacts per user. The short codes (1-99) can be assigned to any of the 999 entries in the contact list. The short codes are used to address other users when setting up instant groups on the TUI.

From this use case it is possible to invoke the use
20 cases:

- Add contact
- Delete contact
- Generate short code
- Manually enter short code
- 25 • Delete short code
- Search contact
- Modify note

Add Contact

Actors: User.

30 Purpose: Add someone to be part of my personal contact list. Contacts can be used to setting up communities as

well as "Instant groups".

Description: When a user chooses to add a person to his contact list the first thing the system does is to ask for the telephone number or member number of the person he wants to add. The system then checks whether the corresponding contact is already in the list. If not, the system searches the database for a matching entry for the given number (This is done according to the search contact use case). If an entry is found that matches the number the user is asked if he wants to add this user to the contact list. In case the found contact has chosen to hide details the user is informed that some fields of the contact are invisible.

If no entry is found for the given number the use case Invite Friend To The System Via SMS, see below or Invite Friend To The System via Email, see below, (depending on if the system searched for a mobile phone number or a member number) is invoked.

The user can also add contacts by selecting other users that are members of the same communities.

Invite Friend To The System Via SMS

Actors: User.

Purpose: To invite a non-registered person to the system. Description: This use case is invoked by the Add contact use case. The user can invite a person to the system without inviting the person to a specific group.

The system informs that an SMS will be sent to the current mobile phone number inviting the receiver of the message to the system. The user is further given the possibility to enter an email address in order to additionally send an email invitation. The email is sent out (with the user's e-mail address as sender. If the user has not specified an email address in his profile he can not use this function). To become a user the invited

person need to register using the TUI or WEB interface as in the normal case.

Invite Friend To The System Using Email

Actors: User.

- 5 Purpose: To invite a non-registered person to the system.
Description: This use case is invoked by the Add contact use case. The user can invite a person to the system without inviting the person to a specific group.

- 10 This use case is similar to the use case Invite Friend To The System Via SMS. The difference is that an SMS will not be sent and that the user is informed that he must specify an email address in order to send the invitation. The email invitation is identical to the corresponding part in use case Invite Friend To The System Via SMS.

- 15 Only users with a registered email address can use this function.

Delete Contact

Actors: User.

Purpose: Remove a person from ones contact list.

- 20 Description: Removing a user from ones personal contact list is a permanent action; there is no "wastebasket". The user cannot undo this action.

Generate Short Code

Actors: User.

- 25 Purpose: To assign a short code for a contact in the contact list.

- Description: The user can generate a short code to any of the contacts in his list by using the function for automatic generation of short codes. Lowest available
30 number is assigned.

Manually Enter Short Code

Actors: User.

Purpose: To enter a short code for a contact in the contact list.

Description: The user can change short codes manually by entering a new short code in the field for "Short Code". If the user enters a code that is already used for another contact he will be informed by the system that
5 will give him another recommended number (the lowest available number) and show him which contact that is currently owning the short code. The user is informed that if he still wishes to add the selected short code he needs to delete the short code from the existing contact.

10 Delete Short Code

Actors: User.

Purpose: To delete a short code for a contact in the contact list.

Description: If the user chooses to delete a short code
15 the "Short Code" field is left empty. The deleted short code is then available to assign to another contact.

Send Group Email

Actors: User.

Purpose: Sending Group Email to a community.

20 Description: The user shall be able to send an e-mail from the web when he is logged in to the service.

The e-mail should be sent to all members of the community that have registered to the system with an e-mail address. Only users that have chosen to have their
25 profile visible to other users in that community should have their addresses displayed to others. The sender's name and e-mail address displayed on the sent e-mail should be the community member performing the action.

The user must have an email address registered in order
30 to be able to send a mail, otherwise this function can not be used.

Register On Another Website

Actors: Guest.

Purpose: Register and login to the system from another

web site.

Description: The system supports the use of an adaptable area with text fields to be filled out by the guest (name, e-mail address and mobile number). The adaptable
5 area will be placed on partner sites and integrated with the content shown on that site.

Once the fields are filled out and the guest click on the "log-in button" the guest is forwarded to the login page of the MC system and the user information shall appear in
10 the correct fields. The guest has to review the conditions of membership (or accept without reviewing) and submits the registration request to the system.

International Access

Actor: User, Guest

15 Purpose: To get access to all Incirco country specific sites.

Description: The system (in Sweden) contains a .com page with links to all other Mobile Community system "Web Welcome" sites (see above) in different countries. The
20 guest/user will be directed to the country specific "Web Welcome" site by clicking on the link.

Personal data

Actors: User.

Purpose: Modify ones own personal data.

25 Description: A user may modify his own personal profile.

The user may for example elect to change his phone number. If the mobile phone number is changed, the user will be asked to confirm the new number also as his new member number. However, both these changes require an SMS
30 validation using a temporary code in accordance with the registration procedure. If the user is a community owner and chooses to un-register his mobile phone number he must hand over the owner ship to someone else in that community. Otherwise the phone number can not be un-
35 registered.

Change Community Owner

Actors: User.

Purpose: Change to a new community owner.

- Description: The existing community owner assigns new
5 community owner. All community members are then notified
via the "Member news". Only the users that are registered
with an SMS capable phone are selectable for taking over
the community ownership.

Search Contact

- 10 Actors: User.

Purpose: To search for a user to add to the contact list.

Description: The user enters phone number or member
number of the user he wishes to add to the contact list.
The system searches in the database for a matching entry.

- 15 If the system finds a corresponding user he is added to
the contact list.

Modify Note

Actors: User.

- Purpose: To update a description of a contact in the
20 contact list.

Description: The user may add an own description to each
contact in his contact list. This use case addresses how
a user can add and modify a description of a contact.

Web Introduction

- 25 Actors: Guest.

Purpose: Introduce and interest a new user to the member
services.

Web Logout

Actors: User.

- 30 Purpose: Logout from the web site member services.

Description: Logout is a permanent action; there is no
"wastebasket". The user cannot undo this action and is
transferred to the welcome page.

Web change PIN code

Actors: User.

Purpose: To change PIN code

Description: The user may change the PIN code (four digit PIN code) after successful login. The user must first
5 enter the old PIN code, then the new PIN code and finally a confirmation of the new PIN code.

Quit Membership

Actors: User.

Purpose: Enables the user to quit the member services.

10 Description: Quitting is a permanent action; there is no "wastebasket". The user cannot undo this action.

Mailbox

Actors: User.

Purpose: To enable users to view community activities.

15 Description: The system will log messages and member activities. Any user in a community can view the message log to see who have sent a message and when, and also when other members last time accessed the member services and this community.

20 Member List

Actors: User.

Purpose: View list of members in a community.

Description: The user can view name, email and mobile phone number of all members in a community. In addition
25 to this information, the user can view all rejected invitations. The user, in the role of community owner, may choose to invite new members or remove members from the community.

Remove Members

30 Actors: User.

Purpose: Remove members from a community.

Description: The community owner may remove any member from "his" community. A message is send to the removed members by email (preferred) or SMS. All community

members are notified via "Member news". Removing a member is a permanent action; there is no "wastebasket". The user cannot undo this action.

Delete Community

5 Actors: User.

Purpose: To permanently delete a community.

Description: The community owner may permanently delete the whole community. A message is sent to all members by email (preferred) or SMS. A recall function is not
10 needed.

Leave Community

Actors: User.

Purpose: Remove oneself from a community.

Description: Any member can remove himself as a member of
15 a community. A message is sent to that member by email (if he has an email address) and to the community owner. All group members are notified via the "Member news".

Telephony use cases

The telephony use cases are use cases related to
20 functions and operations performed from a mobile or stationary phone.

Phone Register

Actors: Guest, Instant user.

Purpose: To gain access to the service from a phone
25 (fixed or mobile).

Description: A guest or instant user has the possibility to join the service without having internet access. This use case addresses the case when a guest or instant user wants to register from a phone. A guest will get to this
30 use case from the Phone login use case. An instant user will get to this use case from the Phone welcome instant user use case. Then follows a telephone dialog helping the person to register. Authentication is performed in the same way as in the web register use case.

Phone Login

Actors: User, instant user, guest.

Purpose: User: To gain access to the telephony member services and authenticate user. This will be the entry
5 point for telephony services. Instant user: To detect the A-number and route the instant user welcome use case.

Guest: To route the guest to the Phone register use case

Description: Whenever possible, A-number detection is
10 used to identify the user (or instant user) and the access code is then not required. If A-number is unknown, the user is asked to provide his member number and access code, e.g. using a borrowed (not registered) mobile phone is also handled by this use case.

In case an instant user is detected the use case Phone
15 welcome instant user is activated, see below.

In case the user calls from a non-SMS capable phone the member number and the access code must be given.

In case A-number detection failed the person might be a guest calling to the system for registration. In that
20 case the person is given the possibility to register, and the Phone register use case is then activated.

If the user is asked to enter the access code he is allowed to make only a limited number of trials if wrong access code is given. This holds for both mobile and
25 fixed phones. If wrong access code is given too many times the account is temporarily blocked.

When the user is logged in, the system will perform a check to see whether there are any ongoing group talks. The system also checks if the user has a recorded spoken
30 name or not. If the system determine that the user do not have a spoken name he should be asked to record one. The name is later used in services using spoken names. If the user has any invitations to communities that he hasn't joined or declined the system informs about this.

The first time the community owner logs on via telephony services after having created a new community, he is asked to voice record the community name. This is also the case if the user has changed the name of the community on the web user interface.

If there are any new system messages, these will be played.

The user is also informed if he has been removed from any communities.

10 The use case addresses the case where too many users are trying to access the telephony services at the same time thus consuming all system hardware and software resources.

Phone Welcome

15 Actors: User.

Purpose: Main menu of telephony services.

Description: The system

- checks if there are any ongoing group talks
- checks if there are any new group messages
- 20 • tells if there is member news
- guides amongst all telephony functions and operations.

Phone Welcome Instant User

Actors: Instant user.

Purpose: Main menu for an instant user.

25 Description: The system welcomes the instant user to the system. If there is an ongoing instant group talk the instant user will be directed to this. If there are instant group messages the instant user is given the possibility to listen to them. The system will also give
30 the instant user the possibility to register.

Phone Change PIN code

Actors: User.

Purpose: To change PIN code

Description: The user may change the PIN code (four digits) after successful login. The user must first enter the old PIN code, then the new PIN code and finally a confirmation of the new PIN code.

5 Phone Join Community

Actors: User.

Purpose: Accepting community invitations via phone.

Description: The system checks whether the user has new community invitations that are unanswered.

10 If there exist such unanswered invitations the user is given the choice to join the communities or to decline the invitations. The name of the user that has sent the invitation and the group name are read out (spoken name) for each invitation.

15 If the user chooses to join the community he is asked to specify whether he shall be visible or invisible to other users of the community

If the user neither join nor decline the invitation an alert notification is sent to the user reminding him/her
20 that the invitation isn't replied to. The time delay for the alert is configurable by the system administrator.

Phone Set Up Instant Group

Actors: User.

Purpose: Allow a user to quickly set up a non-defined
25 Group Talk (or Group Message) community.

Description: From the TUI, the user enters phone number/member number of other users and/or phone number of instant users to invite them to a group talk, or group message. If the user invites any person from the contact
30 list with a two-digit code assigned the user can enter the code instead of the whole telephone number/member number.

The system guides the user through a number of prompts and the user interacts with the system using DTMF

commands. If the user invites a person with a forbidden number (i.e. the user states a number stored in the "Dialing Rules File") the user shall be notified and that invitation is cancelled.

- 5 The user is given the possibility to review the instant group, i.e. the names of the members of the instant group are read out, using spoken name. If the group contains instant users or if no spoken name is assigned to a user the corresponding phone number will be read out instead.
- 10 The instant group that is created shall be saved in the system and the user can initiate a group talk with the participants in the instant group without having to enter their numbers again. The instant group created is saved in the system and replaced the next time the user create
- 15 a new instant group. A user can only have one instant group defined.

Phone Create Community

Actors: User.

Purpose: Creating a community from the Telephone User

- 20 Interface.

Description: Users shall be able to set up new static communities via the telephony user interface. This is done in the same way as setting up instant groups via the telephony user interface. If the user invites a person

- 25 with a forbidden number (i.e. the user states a number stored in the "Dialing Rules File") the user shall be notified and that invitation is cancelled.

The user will be asked to make a recording of the group name, and the group will be given a temporary name,

- 30 typically a time stamp, that will be displayed on the web interface until the name is updated by the user, see above.

If an invited person (user or guest) hasn't replied to the invitation within a predefined number of days (a

- 35 system parameter configurable by the system

administrator) an alert might be sent to the community owner. An alert might also be sent to the invited person. It is possible to configure these alerts independent of each other, e.g. in one implementation if the system both
5 kinds of alerts might be used, but in another implementation, only the alert directed to the community owner might be used.

Phone Initiate Group Talk

Actors: User.

10 Purpose: Allow a user to use Group Talk.

Description: The user selects any community (or the instant group) to invite for Group Talk. The system will then initiate an outgoing call to all invited users (or instant users) leaving a short message and an email
15 notification. The out dial message will be at least 25 sec long, consisting of a repeated message of an approximate length of 7-10 seconds repeated continuously until the called party hangs up or the time limit (25 sec) is reached.

20 The out dial message might contain the name of the user initiating the Group Talk and the name of the community ("spoken name" usage). What actually is included in the message is configurable. If no spoken name is recorded for the user the system is "silent" instead of reading
25 the user's spoken name. For line busy calls a SMS will be sent.

Note! Out dial notifications are not performed to non-SMS capable phones!

30 Then the Group Talk continues, and while waiting for the first person to join the call, for example advertisements can be played.

A Group Talk is automatically recorded by the system during a limited time. The Group Talk recording may be accessed as a standard message later on. The recorded

message is automatically deleted after a system set predefined time.

The use case addresses the case where too many users are trying to access the Group Talk service at the same time
5 thus consuming all system hardware and software Group Talk resources.

The use case also addresses the case when the receiving part of the out dial is an answering machine. In this case the out dial shall be aborted.

10 Note! An out dial notification is initiated according to a special sequence. This scheme is given in the UCR.

Leave message

Actors: User.

Purpose: Send a voice message to group members.

15 Description: The user selects which group to address. He then records the message and ends by pressing the # sign. The message is recorded in the Group Message store. An SMS notification and an email notification (if the member has registered the email address) are automatically sent
20 to all group members, urging them to call in and listen to the message. SMS is however not sent to members that still have unchecked messages in that that group. SMS is neither sent to users using a non-SMS capable phone. These users shall receive an email notification if an
25 email address is registered. If no email address is registered the non-SMS capable phone user will not get any notification at all for Group Messages.

Instant user will not receive any notifications.

For community messages, the name of the person doing the
30 recording, and the time, is registered in a message log that is accessible from the web site member services.

Listen To Message

Actors: User, Instant user.

Purpose: Listen to Group Message or Group Talk

recordings.

Description: When the user calls in to the service, he is notified that there are new group messages and/or group talk recordings (the system distinguishes between group messages and group talk recordings, i.e. the system informs how many recordings of each type that are available). For each recording the corresponding group name is read out (this is not the case for Instant group messages and recordings of instant group talks. In that case the spoken name of the user that set up the instant group is read out). The user/instant user is asked if he wants to listen immediately or later. If the user chooses to listen immediately he will before the message hear information on when it was created (date and time). If the user do not want to listen to the timestamp he can press the "#" button and then be directed to the message.

Having listened to the message, the system will give the user the possibility to listen to the status of the message, i.e. what other users have listened to the message (using spoken name). Note that this is an option. Further, the user has the choice of appending an own message to the previous one (note that this is not possible to instant group messages and instant group talk recordings). If so, he records the Group Message. An SMS notification and an email notification (if the member has registered the email address) are automatically sent to all group members, urging them to call in and listen to the message.

Each user shall start listening to the first recorded message that he hasn't listened to before. The user can skip messages and jump to the next recorded message.

As a person has listened to a message, this is notified in the message log so that the initiator of the message can see on the web, or listen to on the TUI that the message has reached its intended audience.

Phone Change Name Of Community

Actors: User.

Purpose: Change name of an existing community.

Description: The user has the possibility to change name of any community he has created. The user can not change
5 name of communities for which he is not the community owner. All members of the community are notified. The notification is performed in the same way as the invitation to the group (but telling the members that the current community name is changed).

10 Phone Record Spoken Name

Actors: User.

Purpose: Record spoken name.

Description: After having registered the user is prompted to record a spoken name. This recording is used later,
15 when the system needs to present the name of the user over the phone interface.

Phone Personal Settings

Actors: User.

Purpose: To change personal settings from the TUI

20 Description: The user can from this use case change some of the personal settings. These are:

- The spoken name
- The PIN code.

Phone Quit Membership

25 Actors: User.

Purpose: To quit membership from the TUI

Description: The quitting is permanent. The user cannot undo this action.

Phone Change Anonymity

30 Actors: User.

Purpose: To change the user's anonymity setting from TUI.

Description: The user gives the possibility to change the anonymity setting, i.e. whether he shall be visible or

invisible to other users when these are using the public functions of the system.

Phone Community Administration

Actors: User.

5 Purpose: To administrate communities from the TUI.

Description: The user can administrate communities from this use case. The functions that can be performed is:

- Change the spoken community names
- Create community
- 10 • Set up instant group
- Invite members
- Leave a community

Phone Invite Members

Actors: User.

15 Purpose: To invite additional members to a community from the TUI.

Description: The user can invite additional members to an existing community. The user must be owner of the community. If a user hasn't replied to an invitation
20 alerts are sent according to above section regarding invitation of members.

Phone Leave Community

Actors: User.

Purpose: To leave a community from the TUI

25 Description: The user can leave a community from the TUI. If the user is the community owner he must assign a new community owner or delete the community. Members of the community are informed that the user has left the community.

30 Join Group Talk

Actors: User, Instant user.

Purpose: To join a Group Talk session or an instant group talk session.

Description: The user may join a Group Talk either directly after he has logged in using a phone or from the main menu. The instant user may join an instant user group talk from the Phone welcome instant user use case
5 if there are any instant user group talks for that instant user.

If the user is invited to more than one simultaneously ongoing Group Talk sessions, the system will ask which one he'd like to join, i.e. "For Footballers, press 1;
10 for Dart buddies, press 2." If the user/instant user is invited to one or more instant group talk sessions the system will read the name of the user that set up the current instant group.

Phone Settings

15 Actors: User.

Purpose: Record group names.

Description: When the user calls in after having created a new community, he is prompted to record the community name. This recording is used later, when the system needs
20 to present the community name over the phone interface.

Phone Help

Actors: User.

Purpose: Get helpful information and tips.

Description: It shall be possible to have support and
25 guidance read in the phone by entering a certain phone key from most phone menus.

Administrative use cases

Administrative use cases are functions performed by the administrator actor in order to maintain and modify the
30 Mobile Community system.

Admin Welcome

Actors: Administrator.

Purpose: To navigate the administrative services.

Description: This is the administrative web site start

page. From here the administrator access the administrative functions and operations of the system. The administrator can here view a log of administrator activities. This log is "read only". In this log it is
5 displayed who logged in as administrator and when.

Update Email addresses Rules

Actors: Administrator.

Purpose: To update the file containing forbidden email addresses.

10 Description: This use case describes how to update the file that contains email addresses that are forbidden to send messages to. The administrator can specify specific addresses, domain or sub domain names.

Update Dialing Rules

15 Actors: Administrator.

Purpose: To update the file containing forbidden outdial numbers.

Description: This use case describes how to update the file that contains telephone numbers that are forbidden
20 to dial. Such numbers are for example international numbers, premium rate numbers, emergency numbers etc. The administrator can specify numbers as well as number series using wildcards: E.g. 112; 90 000; 071*; 00*.

Add User

25 Actors: Administrator.

Purpose: Add new user.

Description: This use case describes how to add a new user to the system.

Search Users

30 Actors: Administrator.

Purpose: To view all or defined part of registered users.

Description: The search may be performed using some basic search criteria as for example name, email, member number, mobile phone number, registration date and reason

for blocking. It is possible to sort the output alphabetically using system-predefined columns.

Delete User

Actors: Administrator.

- 5 Purpose: Delete an existing user.

Description: This use case describes how an existing user may be deleted from the system. When a user that is deleted is a community owner the community shall be terminated and the other users in the community shall be notified via e-mail.

Modify User

Actors: Administrator.

Purpose: Change the properties and settings of a user account.

- 15 Description: This use case describes how user details may be modified within the system.

Any user can be blocked from accessing the member services. Once a user with a certain phone number is blocked, he will need to apply to the administrator by email to be able to register a new membership using the same phone number. Reasons for blocking can be:

- Too many login attempts on web
- Too many login attempts on TUI
- Blocked by administrator (and that case which administrator)

For blocked users it is also displayed when the user was blocked.

System Parameters

Actors: Administrator.

- 30 Purpose: Manage system parameters.

Description: Administrators may set and change system parameters. Among those parameters are "Max simultaneous

users in Group Talk", "How long time a recorded messages will be saved".

Usage Pattern Statistics

Actors: Administrator.

- 5 Purpose: Evaluating system usage.

Description: The administrator can see key data concerning the usage pattern of the system services, e.g. how many groups different persons initiate, group sizes, number of SMS sent compared to traffic generated etc. The
10 system logs all logins at the TUI and WEB. For TUI accesses it is possible to see the length of each session as well as initiated SM and out dials during a session. For WEB the length of each session (until logout) is logged- if the user leave the site without doing a proper
15 log-out it is possible to distinguish that session from other sessions.

Traffic Volume Statistics

Actors: Administrator.

Purpose: Billing of operators.

- 20 Description: Total voice traffic as well as total SMS traffic during a specified period is presented per operator. The administrator is further allowed to access and upload the traffic log file from the system. The traffic log file contains MSISDN/member number and
25 start/stop/duration for each call.

Administrator Rights

Actors: Administrator.

Purpose: Specifying rights to other administrators.

- Description: The "master" administrator can specify what
30 rights the other administrators of the system will have.

Administrator Update WEB

Actors: Administrator.

Purpose: To change and update WEB sites, strings in SMS, email etc. when the system is running.

51

Description: The administrator with access rights (according to what has been set for him in use case regarding administrator rights) to update web pages is able to change all text content of the site's pages without interrupting the service. The administrator (according to what has been set for him in use case regarding administrator rights) can also update the text used in Short Messages sent from the system as well as standardized e-mail texts sent from the system.

10 Admin Login

Actors: Administrator.

Purpose: To gain access to the administrative services and administrator authentication.

Description: This is the administrative web site entry point. From here the administrator access the administrative functions and operations of the system. The administrator is required to enter his/her username and password. After successful authentication the administrator is transferred to the Admin Welcome page.

20 For example, <http://admin.incirco.com>

Admin Logout

Actors: Administrator.

Purpose: To exit the administrative services.

Description: The actor activates logout function or an automatic logout by a time-out. After logout the actor is redirected to the start page of the administrative web, the Admin welcome.

Admin Help

Actors: Administrator.

30 Purpose: Get helpful information and tips.

Description: It shall be possible to obtain help text on most administrative web pages. However, advanced help texts are not required. It shall also be possible to print a quick guide from the web.

Add Administrator

Actors: Administrator.

Purpose: Add new administrator.

Description: This use case describes how to add a new
5 administrator to the system.

Search Administrators

Actors: Administrator.

Purpose: To view all or defined part of registered
administrators.

10 Description: The search may be performed using some basic
search criteria as for example name, email, member
number, mobile phone number, and registration date. It is
possible to sort the output alphabetically using system-
predefined columns.

15 Delete Administrator

Actors: Administrator.

Purpose: Delete an existing administrator.

Description: This use case describes how an existing
administrator may be deleted from the system.

20 Modify Administrator

Actors: Administrator.

Purpose: Change the properties and settings of an
administrator account.

Description: This use case describes how administrator
25 details, as password, may be modified within the system.

Add Community

Actors: Administrator.

Purpose: Add new community.

Description: This use case describes how an administrator
30 may add a new community to the system for an arbitrary
user.

Search Community

Actors: Administrator.

Purpose: To view all or defined part of registered communities.

Description: The search may be performed using some basic
5 search criteria as for example name, symbol, and
registration date. It is possible to sort the output
alphabetically using system-predefined columns.

Delete Community

Actors: Administrator.

10 Purpose: Delete an existing community.

Description: This use case describes how an administrator
may delete an existing community from the system.

Modify Community

Actors: Administrator.

15 Purpose: Change the properties and settings of a
community.

Description: This use case describes how an administrator
may modify arbitrary community details within the system.

An administrator can block any community. Once a
20 community is blocked, the community owner will need to
apply to the administrator by email to be able to reopen
the community.

Broadcast Message

Actors: Administrator.

25 Purpose: Inform users of needful things, like system
updates etc.

Description: The administrator can send email or voice
message to all users or to a selected part thereof.

Alarm Settings

30 Actors: Administrator.

Purpose: Configure alarms.

Fault Management

Actors: Administrator.

Purpose: Detect errors and inform the system administrator.

Description: A function monitors the hardware and software and reports errors to a fault management application.

Further functions

The following will describe functions that cannot easily and understandably be analyzed or described as a use case.

Spoken name

The system supports the use of spoken name for all users. The spoken name is recorded from the TUI at the first login to the system using the TUI.

15 Detect answering machine

The system is able to detect an answering machine when performing out dials.

Support for users with a fixed phone only

The system accepts users without SMS capable phone. For members that are users of the system using such a phone SM notification is not available as an option. When logging in to the system from such a phone A-number detection should not be used, i.e. the user have to state the member number and the access code.

25 Automatic configuration of notifications

In some countries, it is foreseen that out dial notifications might be forbidden or restricted to a certain group of users. The system shall be able to configure on a per user basis what notification method that should be used when a Group Talk is initiated. The notification schema per user should be set to a default value and can be controlled by the application (i.e. can differ per country). The configuration is determined by

what user data are given when registering, and by the country setting.

Support for instant users

5 a) The system supports participation of non-registered users in Group Talks. The system remembers numbers of instant users that has been invited to an instant group so that they can be given a separate dialogue when entering the system. This feature allows users to invite persons that have never heard about the MC system to join
10 an instant group talk. Out dial notification is performed in the same way as for a regular user, the instant user will get another notification message though.

b) When an instant user has participated in a Group Talk (and the group talk has been terminated) he should
15 receive a short message with information about the service.

Access to external directories/use of LDAP directory

The system supports LDAP for access to external directory information. This can be used to synchronize data with
20 other directories and to import data from another user directory via LDAP. It is also possible to export data to another user directory. An external system is allowed to query the MC system for certain information via LDAP. In the same way - the MC system is able to query an LDAP
25 directory for user information. The queries are done "online".

By allowing LDAP access directly to the MC system (the MC user register/directory - or even using LDAP for lookups internally in the system) other applications are allowed
30 to integrate into the MC system and benefit from the user information that already exists there. Many new applications are built around a LDAP directory and using a directory within the MC system means that it is possible to load those applications schemas into the MC
35 directory.

Statistics from WEB access

The system delivers reports on WEB usage. It is possible to detect individual users so that the number of unique users can be determined, not only the total number of hits.

SMS-C Interface

a) The system supports an interface to external SMS-Cs in a modular way so that adaptation can be made to interface new SMS-Cs without having to redesign the service.

10 At least the following interfaces are supported

- SMPP ver 3.3 over TCP/IP
- SMPP ver 3.3 over X.25
- UCP over TCP/IP
- UCP over X.25

15 b) The system routes the call to the correct SMS-C by identify which operator that is assigned to the current user (the operator is stored in the user's record). Hence, several protocols are supported in parallel in one installation. The information of operator is determined
20 by the system by analyzing the phone number entered at registration. The system is able to analyze the six first digits in the telephone number. At least 16 operators are able to be determined.

This feature allows the system to use multiple SMS-Cs for
25 notification

Support for international versions

a) The system is built in such as way that it can be adapted to the local market without the need for system modifications. This is attached to the following issues:

- 30
- Language used on WEB pages
 - Voice prompts

- Language/Text used in SM sent out for notification purposes
- Language/Text used in e-mails sent out for notification and information purposes
- 5 • Language used in out dial notification.
- Set up of dialing rules (non-allowed out-dial numbers).
- ISDN parameters
- b) Other partners (local) can used to translate the
- 10 system into any language.

Dialling rules

The system allows out dial to different number series specified in a "Dialing rules" file. If the user with a forbidden out dial number has SM capabilities a SM should

15 be sent to notify that user. The group talk owner shall be notified if all invited users can not be notified.

Email rules

The system allows for not sending email to certain addresses or domain/subdomain series which are specified

20 in a "Email rules" file.

Secure access for system administrators

- a) The system supports a secure connection for remote login by the administrator. The system requires preferably a certificate from the administrator's
- 25 terminal.
- b) In order to keep track of possible unauthorized access to the system administrator account, all logins should be logged with time and IP address of the person logging in as system administrator.

30 Alarm handling and monitoring

The system supports alarm handling via SNMP to a SNMP manager (not part of the system).

Protection against misuse

All communication systems can be subject to spam and misuse by users or guests.

5 a) The system supports a function to limit the amount of out dials that are initiated by a certain user (i.e. through set up of group talks) and block users that exceed such value. The system supports an alarm function that will be triggered if a user exceeds a certain number of initiated out dials during a 24 hour period. The
10 parameters is administered through the system administration interface (web).

b) The system supports a function to limit the amount of SM that are initiated by a certain user (i.e. through leaving group messages and by inviting new users) and
15 block users that exceed such value. The system supports an alarm function that will be triggered if a user exceeds a certain number of initiated SM during a 24-hour period. The parameters are administered through the system administration interface (web).

20 Safety aspects

a) The system preferably uses a PIN code for authentication on the WEB interface and on the TUI interface.

b) The system keeps a log of all accounts temporary
25 blocked due to failed logon, and shall send an alarm upon high volumes of temporary blocked accounts. The system shall also send an alarm if an account is blocked more than 20 times during a period of 1 week.

c) When logging out from the system, the webpages should
30 preferably not be allowed to be cached in the browser

d) UserID and password shall preferably not be allowed to be handled as part of an URL.

e) All entry fields on the website must have "Boundary checks" to ensure that the indata is of desired type.

This checking should be done in the browser. (Otherwise there is a risk for e.g.: one can append a 20 MB file in one entry field, making the system crash etc.) Boundary checks must be done on entries between the webserver and the application server in order to prevent unwanted database accesses.

f) The password is preferably encrypted in the browser using MD5 or SHA-1.0 before it is sent from the browser to the system.

10 Max Group Size per User Basis.

The system is prepared for future assignment of a maximum size of community on a user basis.

Dynamic text usage

a) It is possible to change web texts without service interruption. The content of the WEB pages is stored so that the text in the pages can be updated separated from the Java Server Pages (jsp). Access to the text is an attribute in the administrator's access rights, i.e. it is possible to restrict access to changing the texts to certain administrators.

b) It is possible to change text used in SMS without service interruption.

c) It is possible to change text used in e-mails without service interruption.

25 Browser compatibility

The system supports at least America Online's Netscape Navigator 4.05 and later versions and MS Explorer 4.01 and later versions.

Multiple message stores and user registers

30 The scale the system, the system is designed to allow configurations with multiple messages stores distributed on several physical servers, and user registers (DB2) distributed on several physical servers..

Speech Recognition and Text to Speech

- a) The system is prepared for supporting speech recognition. Preferably, it shall be possible for the user to assign a spoken name for the persons that the user has put in the contact list.
- b) The system is prepared for Text to Speech translation. It is preferably be possible to e.g. read incoming emails in the TUI.

Security on ISDN lines

- 10 Should the ISDN lines to the CT-servers happen to carry Incoming TCP/IP traffic, the CT-servers shall reject this call.

Auto-maintenance of log-files, user register and message store

- 15 a) The database should preferably be cleaned regularly to ensure that all obsolete data is removed.
- b) Saved data on system usage (e.g. traffic logs etc.) should preferably be automatically archived after e.g. three months storage [system parameter] (and thus removed from the system).
- 20 c) It is possible to automatically remove users that have been inactive for more than x months (x is a system parameter - default value 12 months).

Supervision of CT resources

- 25 The system generates SNMP traps if there is any degradation in the capacity of the telephony interface. The CT resources (SW processes and HW (Line cards, ATM cards, Conference cards and servers)) should be possible to poll for status information. The system monitors activity on the line cards to ensure that they are working properly. If no activity has been detected during a certain time (system parameter) the system generates an alarm.
- 30

Capacity - typical numbers without restricting the scope of the invention:

- a. The system is capable of meeting a subscriber load of 2 000 000 subscribers.
- 5 b. The system supports 1000 simultaneous users on the web.
- c. The system supports 2000 simultaneous users on the TUI.
- d. The system supports full load on 120 ISDN channels and
10 one DCB960 conference board in one NT server with the following configuration:

IBM Netfinity 5000 with 1 PIII 677 MHz processor, 256 MB RAM.

Database possible to update

- 15 The database is designed in a way so that it is possible to update the attributes connected to each user record (i.e. it is possible to add information such as address and other user-unique data to each user record).

Acoustic profile

- 20 The system uses an acoustic profile. This means that different signals will be used to inform the user about different events. The following different sounds may be used:

- Group talk has started
- 25 • New Group message
- Group message (old)
- Group Talk (recorded)
- Waiting signal (while group talk is initiated)
- User enters the group talk
- 30 • User leaves the group talk

Latency

As a measurement for the quality of service the system is designed in such a way that the user never need to wait more than 1 second after he has initiate a comment until the system answers back. The system is equipped with a
5 time-out prompt that is played in case the 1 second threshold is exceeded during moments of extreme load "The system is retrieving data, please wait" or equivalent.

Sound quality

There is no "distorted sounds" when playing any speech
10 prompt.

Background: GSM uses inband signalling to send DTFM signals. This makes the speech channel sound corrupted during about one second after a key is pressed.

Audio codec use

15 The system is capable of being configured to use different audio codecs (supported by the dialogic boards). It shall be possible to use different codecs for recording of group talk and group message (which implies that the system is able to switch audio codec during a
20 call.

Key ahead on TUI

All menus that allows the user to make a choice support key-ahead, i.e. it is possible to choose action without having to listen to the prompt to be completed.

CLAIMS

1. A communication system comprising means for enabling exchange information between users of communication devices in at least one digital communication network,
5 the devices comprising mobile communication stations, the system comprising:
 - means for creating a group with members comprising a plurality of the users,
 - means for storing an incoming information message
10 from a user of a communication device,
 - means for alerting at least a subset of the members that an information message is available.
2. A system according to claim 1, comprising:
 - means for enabling alerted users to access a
15 stored message.
3. A system according to any one of claims 1-2, where the means for creating a group comprises WWW-interface means.
4. A system according to any one of claims 1-3, where the means for creating a group comprises means for creating a
20 group of users originating from different communication networks.
5. A method for enabling exchange information between users of communication devices in at least one digital communication network, the devices comprising mobile
25 communication stations, the system comprising steps of:
 - creating a group with members comprising a plurality of the users,
 - storing an incoming information message from a user of a communication device,
 - 30 - alerting at least a subset of the members that an information message is available.
6. A method according to claim 5, comprising:
 - enabling alerted users to access a stored message.

7. A method according to any one of claims 5-6, where creating a group comprises interaction via WWW-interface means.

8. A method according to any one of claims 5-7, where
5 creating a group comprises creating a group of users originating from different communication networks.

9. A computer software product comprising instructions for a computer system to perform the steps according to any one of claims 5-8.

10 10. A method of enabling exchange information between users of communication devices in a digital communication network, the devices comprising mobile communication stations, the method comprising steps of:

- creating a group with members comprising a
15 plurality of the users,
- distributing information messages originating from at least one member of the group to other members of the group,
- providing simultaneous connections between members
20 of the group.

11. A computer software product comprising instructions for a computer system to perform the steps according to claim 10.

12. A communication system comprising means for enabling
25 exchange information between users of communication devices in a digital communication network, the devices comprising mobile communication stations, comprising:

- means for creating a group with members comprising a plurality of the users,
- 30 - means for distributing information messages originating from at least one member of the group to other members of the group,
- means for providing simultaneous connections between members of the group.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/SE 00/01255

A. CLASSIFICATION OF SUBJECT MATTER

IPC7: H04Q 7/38, H04L 12/00, G06F 13/00, H04M 3/42
According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC7: H04Q, H04M

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched
SE,DK,FI,NO classes as above

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 4761807 A (GORDON H. MATTHEWS ET AL), 2 August 1988 (02.08.88), column 2, line 18 - column 3, line 11; column 28, line 22 - line 45; column 58, line 52 - column 63, line 8, column 67, line 9 - column 73, line 15; column 84, line 62 - column 90, line 33; abstract --	1-9

INTERNATIONAL SEARCH REPORT

International application No.
PCT/SE00/01255

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).:

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/SE00/01255

- I. The invention according to claims 1-9 relates to a communication system for groups in a digital network for mobile stations characterised in that the system have means for storing a message and alerting the users that an message is available.
- II. The invention according to claims 10-12 relates to a communication system for groups in a digital network for mobile stations characterised in that the system have means for distributing information messages from one member of the group to the other members and providing simultaneous connections between members.

Communication system for groups in a digital network for mobile stations are known (See for example US 4761807). Hence, there is no common special technical feature, above the state of the art, characterising the inventions of the first and second group. These groups of inventions are not linked so as to form a single general inventive concept. (See PCT Rule 13.1-3)

(54) Title: A METHOD AND AN ARRANGEMENT RELATING TO GROUPS OF COMMUNICATING USERS

(57) Abstract: Services obtained include group voice messaging and group talk. Private voice mailboxes can be accessed and used by groups of people. When a new message is added or a user wants to initiate a group talk session, an SMS is sent to group members to inform them that they should check the group voice mailbox or inform them that they should call in to join the group talk.

(54) Abstract Title
Sending short messages to groups of users

(57) A group list server 15 is interfaced with a short message centre 13 in a mobile communications network in order to allow a subscriber to send a single SMS message to be copied to a group of recipients. The subscriber is provided with the ability to control membership of the recipient remotely by means of SMS messages in the form of service control messages. The service control messages may contain any of a number of various predetermined commands, which are parsed by the group list server 15 to create and edit group lists held in a database in the short message centre 13.

FIG. 1

FIG. 2

FIG. 3

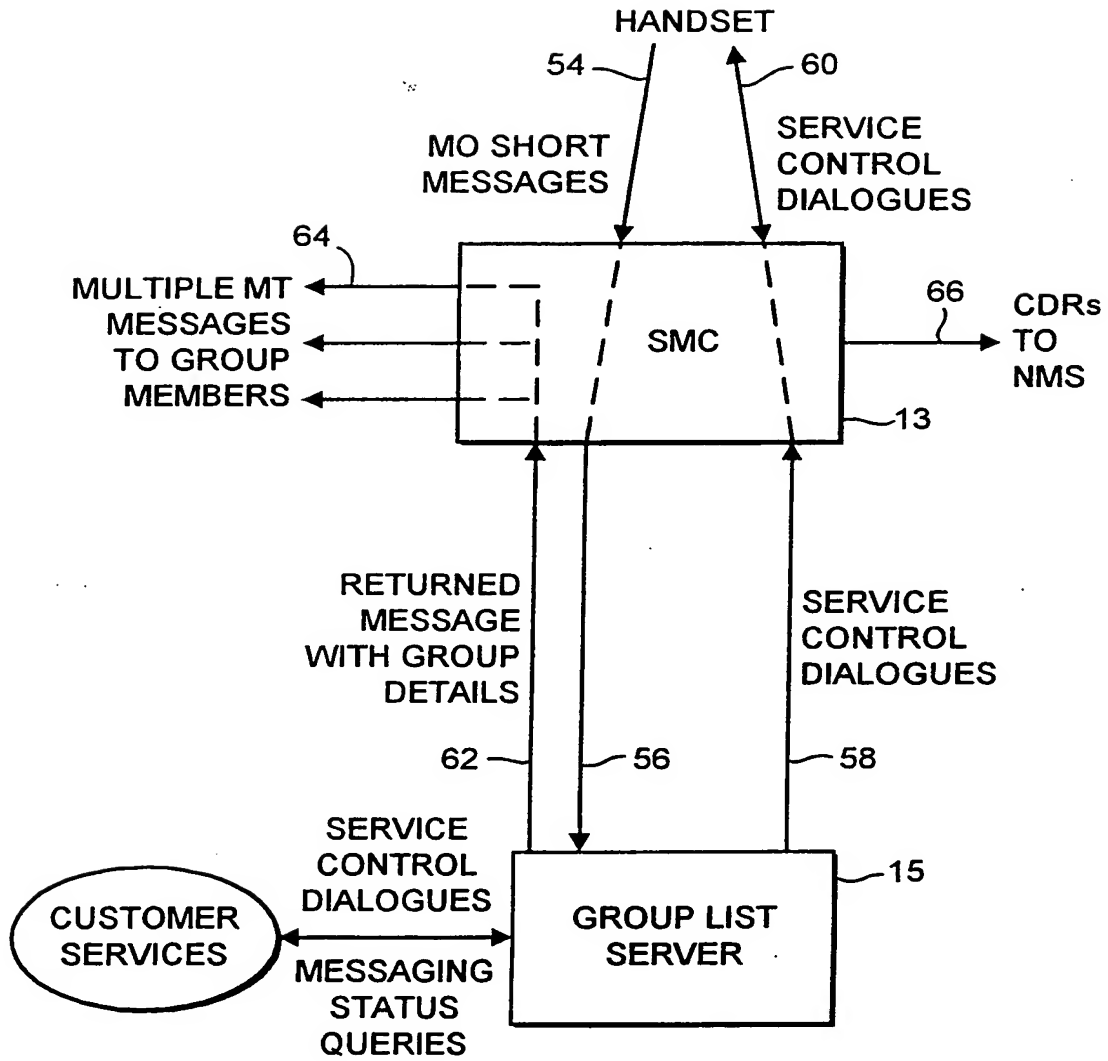

FIG. 4

MOBILE COMMUNICATIONS

This invention relates to mobile communications, in particular but not exclusively to cellular mobile radio communications, such as in a GSM (Global System for Mobile communications) digital cellular radio network.

5 One of the services defined in the technical specifications of the GSM system is a short message service (SMS). This service allows a user of a mobile station to compose a short text message (in the GSM system, of up to 160 characters in length), and to send it to a recipient mobile station via the GSM network. The network includes a short message centre (SMC) which
10 handles the receipt of mobile originating SMS messages from SMS message originators and the forwarding of mobile terminating SMS messages to the intended recipients.

The short message service differs primarily from other types of data services, and indeed voice services, in that no end-to-end circuit connection
15 is established between the message originator and the message recipient during transmission of the message. The term "SMS" as used herein is intended to encompass similar services provided in non-GSM mobile communications networks. For example, Motorola (Registered Trademark) has recently announced the implementation of SMS functionality in a CDMA mobile
20 communications network. The term "SMS" is also intended to apply to messaging services provided in two-way radio paging systems, which operate

transmitting a message to a group of recipients in a mobile communications system, said method comprising:

receiving one or more control message in the form of SMS message(s);

editing a list of a group of recipients in accordance with the contents

5 of said control message(s);

receiving one or more group message to be transmitted to recipients in said group; and

copying said message(s) to recipients in said group. .

Thus, a subscriber may create or edit a group list by direct entry of an
10 SMS message into a mobile station. For example, a subscriber may create a group list by constructing an appropriate SMS message and transmitting the message to the network, and then send a group SMS message to the SMC, which proceeds to copy the group SMS message to all recipients on the list which the subscriber has created previously. The subscriber may then proceed
15 to edit the group list by adding further intended recipients, or deleting intended recipients from the list.

The subscriber may also define an alphanumeric name for each group list which he creates, and transmit the group name to the network. This group name may then be retrieved by the user at a later date in order to aid
20 recognition of the group list which he has created.

The invention may also be utilised in relation to the maintenance of group distribution lists for other types of messages, such as voice messages,

with a large number of such cells, which are ideally contiguous to provide continuous coverage over the whole network territory.

5 A mobile switching centre 2 is also connected via communications links to other mobile switching centres in the remainder of the mobile communications network 10, and to other networks such as a public service telephone network (PSTN), which is not illustrated. The mobile switching centre 2 is provided with a home location register (HLR) 12 which is a database storing subscriber authentication data including the international mobile subscriber identity (IMSI) which is unique to each mobile station 8. 10 The IMSI is also stored in the mobile station in a subscriber identity module (SIM) along with other subscriber-specific information.

The mobile switching centre is provided with a visitor location register (VLR) 14 which is a database temporarily storing subscriber authentication data for mobile stations 8 active in its area.

15 In addition, a short message centre (SMC) 13 is connected to the MSC 2 for implementing the short message service (SMS), as specified in GSM Technical Specification 03.40. A user of a mobile station 8 may generate an SMS message by input to a Man Machine Interface (MMI) (e.g. a keypad) of the mobile station 8, and transmit the message, along with a directory number 20 of the terminating station for the short message, to the servicing BTS 6. The message is forwarded to the MSC 2, which forwards the message on to the SMC 13. The SMC 13 generally holds the message and handles the onward

The interworking protocol applications 42, 48 allow the SMC 13 and the GLS to interface via a data link such as an Ethernet LAN 53 using an application layer protocol, such as the Short Message Peer-to-Peer (SMPP) protocol as provided by ALDISCON of Dublin, Ireland.

5 The provisioning protocol applications 44, 50 allow the GLS 15 to provision, via the data link 53, group lists and group list changes in the group list database 46 of the SMC 13. The provisioning protocol used may be one of the Telepath Provisioning Customer (TPPROCUS) or SMPP provisioning (SMPPP) protocol as provided by ALDISCON, or another suitable protocol.

10 The short message protocol application 40 allows the SMC to receive SMS messages transmitted by mobile stations 8, and to transmit SMS messages to mobile station 8, via the PLMN network.

 In addition to allowing subscribers to send and receive SMS messages in the conventional manner, the arrangement of the present invention allows
15 a subscriber to send a single SMS message which is received by a group of subscribers which the originating subscriber has previously defined. This avoids the need to send an SMS message to each terminating subscriber individually. Subscribers having the capability to send single SMS messages to be distributed to groups of subscribers (referred to herein as "group SMS
20 messages") using the service will be referred to herein as group list subscribers.

 The group list database 46 holds up to a predetermined number of (for

SMS message currently does not exist.

5 If however the corresponding group list exists, the GLS 15 returns the message to the SMC 13, with the MSISDN (in a standardised format) of the originating subscriber and the group list code specified by the subscriber, as shown at 62.

On receipt of the returned group SMS message, the SMC 13 accesses the group list database 46 to retrieve the list of recipient MSISDN numbers held for the originating subscriber and copies the group SMS message to each of the intended recipients, as shown at 62.

10 When the message is delivered to a recipient, the SMC 13 generates a call detail record (CDR) and transmits the CDR to a network mediation system (NMS) for billing purposes, as shown at 66. One CDR is generated for each mobile terminating message generated in the SMC as a result of the group SMS message sent by the originating subscriber.

15 Group list subscribers are also able to control and manage the content of their group lists by utilising various administration, management and control commands which are predefined and are to be included in an SMS message generated in and sent by the mobile station 8 under control of the subscriber using the MMI of the mobile station. These will be referred to
20 herein as "service control messages", and do not include a message for onward transmission to an intended mobile recipient.

In order to originate a service control message, the group list

CT<group list code>[<group name>]

<MSISDN 1>[, <MSISDN 2>...]

The first two mandatory digits of the message following the create (CT) command are the 'group list code'. A list of MSISDNs then follows.

5 In the service control message, [*<group name>*] is an optional text name (selected by the group list subscriber) associated with the group list, and is limited to 20 characters.

As an example, to create a group list held in location 51 the following message text would be sent:

10 *CT 51 sales 0973994834 +44973992750 0966123456*

An error message response is sent to indicate an excessive group name length or number of input MSISDNs.

If the group name exceeds 20 characters the corresponding response SMS message to the mobile station is of the format:

15 *Group <group list code>: Maximum length of group name is 20 characters. Group name saved as: <group name>.*

If the number of MSISDNs in the service control message is too great, the excess MSISDNs are discarded and the response to the handset may be:

20 *Group<group list code> [<group name>]: Maximum number of members exceeds 25. <MSISDN 26> [, <MSISDN 27>...] not added.*

A separate error message is returned to the subscriber to indicate MSISDNs or Local Integrated Numbers (LINs) that are not recognised in the

An example of the concatenated message format is shown as follows:

First concatenated service control message:

CT 51 0973994834 +44973992750 0966123456

<MSISDN 4> ..to.. <MSISDN 9> +

- 5 The corresponding response SMS message that is sent back to the mobile station 8 after each concatenated message that is sent to the GLS 15 is as follows:

Remember, you must send the next part of the message within 30 minutes.

- 10 Second concatenated service control message:

++44973994534, +44973992850, 0976123656, <MSISDN 13>, ..to.. <MSISDN 17> +

The corresponding response message to indicate that another message is expected by the GLS parser is then sent in return.

- 15 Third concatenated service control message:

+0973994534, +44973996750, 0976173456, <MSISDN 21>, ..to.. <MSISDN 25>

- 20 Once the GLS 15 has determined that a full service control command has been received to create a new group list, the GLS 15 sends a provisioning message to the SMC 13, which configures the new group with the details specified in the service control message(s) received.

A response is returned to the mobile station 8 when the group list has

total number of MSISDNs in the group list to exceed the predefined limit, the excess MSISDNs are discarded by the GLS and the response sent to the mobile station 8 is:

5 *Group <group list code> [<group name>]: Maximum number of members exceeds 25. <MSISDN 26> [, <MSISDN 27> ...] not added.*

If no group name field exists against the original group list definition, the input <group name> is provisioned to the SMC database 46 and entered into the group name field.

10 When the GLS 15 determines from the SMC database 46 that one or more number(s) attempted to be added to a group list already exists within the group list then the GLS 15 rejects the number(s) and return the following message format to the handset:

Member(s) already in group <group list code>: <MSISDN 1> [, <MSISDN 2> ...].

15 In instances when one or more number(s) are duplicated within a single service control message when attempting to add a number to a group list, the GLS rejects the number(s) and return the following message format to the handset:

20 *Group <group list code>: Duplicated number(s): <MSISDN 1> [, <MSISDN 2> ...].*

If the user tries to add a group name to a group list that already has an associated group name, the new group name field entry is discarded and an

members within a group list. The format for a service control message containing this command is as follows:

DT <group list code> <MSISDN> [<MSISDN>...]

The corresponding response sent by the GLS 15 to the mobile station 8, once the SMC database 46 has been appropriately provisioned, indicating the command has been executed is as follows:

Group <group list code>: <n> member(s) deleted.

The following error message is returned to the group list subscriber to indicate incorrectly entered MSISDNs that are not members of the edited group list:

Group <group list code>: Number(s) not recognised: <MSISDN 1> [, <MSISDN 2>...].

where <MSISDN> is an unrecognised number.

In instances when one or more number(s) are duplicated within a single service control message when attempting to delete a member from a group list, the GLS 15 shall reject the number(s) and return the following message format to the handset:

Group <group list code>: Duplicated number(s): <MSISDN 1> [, <MSISDN 2>...]

The group list subscriber may transmit a service control message containing a 'wildcard' query of the settings of the subscriber's group lists using a list command. This shall be achieved by submitting an SMS message

defined (i.e. an empty group list) then the following format response message shall be returned to the handset:

Group <group list code> [<group name>]: No member(s).

5 If a group list has been defined with a relatively large number of members within the group and the list service control command is invoked by the user the returned information is returned to the mobile station 8 as a number of concatenated SMS messages.

The following response message is returned when a service control message containing the HELP command is sent by the group list subscriber:

10 *CT: Create Text messaging group.*

ADD: Add member(s).

DT: Delete member(s) or group(s).

TL: List member(s) or group(s).

15 In addition, the group list subscriber is able to request help on any individual command as follows:

HELP [CT] [ADD] [DT] [TL] [HELP]

The GLS 15 returns an appropriate response SMS message containing an explanation of how the commands are used.

20 The following error response message is returned when the syntax of the help command is incorrect:

Invalid help command entered. To use the help command type: HELP HELP.

held in the network in the teleservice node in question, and the GLS would interface with that teleservice node, on receipt of a group service control SMS message via the SMC, in order to create, edit and access the group lists held for the service in question.

- 5 It is also envisaged that various other modifications and variations could be employed in relation to the embodiment described without departing from the scope of the present invention.

transmitting an SMS message to the originator of said control message to inform of an error in a control message.

6. A method according to any preceding claim, wherein said control message(s) comprise one or more of a group list creation command, a group list recipient addition command, a group list deletion command, a group list recipient deletion command, a service help command, and a group list listing command.

7. A method according to any preceding claim, further comprising storing a group list code and/or name specified by the originator of said control message, for identification of said group list.

8. A method according to any preceding claim, wherein said control message comprises a portion which identifies said group list from a plurality of group lists.

9. A method according to any preceding claim, wherein said group message has an originating address which identifies said group list from a plurality of group lists.

10. A method according to any preceding claim, comprising storing

management means which interfaces with a group list storage means on receipt of a control message.

5 17. Apparatus according to claim 16, wherein said group list management means interfaces with said group list storage means when a group message is received.

18. A method, or apparatus, according to any preceding claim, wherein said one or more group messages comprise one or more of an SMS message, a fax message, an e-mail message and a voice message.
